Non-muscle invasive bladder cancer: New standards in endoscopic management and adjuvant instillations

Location: Room Madrid, North Hall (Level 1)

Chairs: M. Babjuk, Prague 5 (CZ)
        M. Brausi, Modena (IT)
        M. Burger, Regensburg (DE)

Aims and objectives of this session
Non-muscle invasive bladder cancer (NMIBC) comprises a heterogeneous group in which tumour number, size, grade and pathological stage (pT) are important prognostic factors related to the risk of recurrence, progression and survival. Transurethral resection of bladder tumour (TURBT) is the reference treatment of NMIBC. The accepted standard for “correct” TURBT is complete macroscopic tumour clearance with specimens of the tumour base and resection border sent separately. A key feature of the pathology report is the presence and/or invasion of lamina propria or muscularis propria, the latter being dependent upon the presence of detrusor muscle (DM) in the TURBT specimens. It is now well established that a “correct” TURBT positively influences recurrence and progression. This session aims to provide an overview of new techniques available to improve the quality of TURBT and the deliverance of adjuvant bladder instillations.

Poster viewing of 20 minutes. Presentations will take place on stage. Standard presentations are 2 minutes in length, followed by 2 minutes for discussion.

655
Active surveillance for non-muscle invasive bladder cancer (NMIBC): Result from bladder cancer Italian active surveillance (BIAS) project
By: Hurle R. 1, Lazzeri M. 1, Saita A. 1, Forni G. 1, Buffi N. 1, Casale P. 1, Lughezzani G. 1, Peschechera R. 1, Pasini L. 1, Zandegiacomo S. 1, Benetti A. 1, Lista G. 1, Maffei D. 1, Cardone P. 1, Colombo P. 2, Guazzoni G. 1
